(57) Abstract :
ABSTRACT A COMPUTER-IMPLEMENTED TIME-SERIES FORECASTING SYSTEM A computer-implemented time-series forecasting system (100) receives sequential time-series data via input module (101, 201). Data-splitting module (102, 203) divides it into training and testing datasets, with preprocessing module (202) normalizing, scaling, smoothing, or differencing data. Dataset-creation module (204) generates supervised sequences using sliding-window mechanisms for LSTM model module (205), while ARIMA model module (103) determines parameters (p, d, q). Model-training module (104, 206) trains both models on training data. Prediction module (105, 207) produces outputs, inverse-transformed by module (208) to original scale. Error-metrics module (107, 209) computes accuracy using actual values from module (106). Future-forecast module (108) enables multi-step projections, enhancing hybrid forecasting precision.
